

UI Theme, Color & All Screen-Size Rules

Frontend design-system specification for the anonymous, local-first Pomodoro product. This document defines the visual language, color tokens, typography, component rules, breakpoints, fluid sizing, mobile/tablet/desktop behavior, accessibility, and implementation constraints.

1. Design Direction

The interface should feel calm, premium, focused, and visually lightweight. The countdown is always the primary visual element. Decorative backgrounds may create atmosphere, but they must never reduce readability or compete with the timer.

- Original visual identity: do not copy the reference product's logo, artwork, proprietary assets, exact branded illustrations, or copyrighted visual composition.
- Minimal chrome: keep the number of simultaneously visible controls low.
- Rounded, soft surfaces with restrained shadows and optional glass treatment.
- Timer-first hierarchy on every screen size.
- Background-aware contrast: foreground controls remain readable over every supported background.
- Animations are subtle, optional, and must respect reduced-motion preferences.

2. Core Color System

Token	Light value	Dark / overlay value	Use
--bg	#F7F7F5	#0F1115	Primary application background
--surface	FFFFFF	#181B21	Cards, sheets, dialogs
--surface-soft	#F1F2F4	#20242B	Secondary surfaces
--text-primary	#17191D	#F7F7F5	Primary text / timer
--text-secondary	#666B74	#B6BBC4	Supporting text
--border	#E2E4E8	#343942	Borders/dividers
--focus	#E85D3F	#FF765A	Focus mode accent
--short-break	#2E9B74	#4EC99B	Short-break accent
--long-break	#4C78D0	#75A2F4	Long-break accent
--warning	#B7791F	#F2B84B	Warnings/streak states
--danger	#C94343	#F26B6B	Destructive/error
--success	#27835F	#49BE8D	Success/completion
--overlay	rgba(0,0,0,.35)	rgba(0,0,0,.50)	Background readability layer

Color rules

- Focus, short-break, and long-break colors communicate mode; never rely on color alone—always show the textual mode label.
- Primary action uses the current mode accent when contrast is sufficient.
- Danger red is reserved for destructive actions/errors; it is not a decorative accent.

- Use semantic tokens in code rather than hard-coded colors inside components.
- Background images receive a dynamic or fixed darkening overlay whenever necessary for readable foreground content.
- Aim for WCAG AA contrast for normal text and controls.

3. CSS Token Baseline

```
:root { --bg: #F7F7F5; --surface: #FFFFFF; --surface-soft: #F1F2F4; --text-primary: #17191D;
--text-secondary: #666B74; --border: #E2E4E8; --focus: #E85D3F; --short-break: #2E9B74; --long-break:
#4C78D0; --success: #27835F; --warning: #B7791F; --danger: #C94343; --radius-sm: 10px; --radius-md:
16px; --radius-lg: 22px; --radius-pill: 999px; }
```

4. Typography Rules

Element	Rule
Font family	Inter or another highly legible original sans-serif; system fallback required.
Timer	clamp(4.5rem, 14vw, 11rem); 600 weight; tabular numerals; tight line-height.
Page title	clamp(1.5rem, 3vw, 2.25rem); 600–700.
Section heading	18–24px depending on viewport.
Body	14–16px; line-height about 1.5–1.65.
Small/meta	12–14px; never use tiny text for important controls.
Buttons	14–16px; 600 weight for primary actions.

5. Spacing, Radius & Elevation

System	Rule
Spacing scale	4, 8, 12, 16, 20, 24, 32, 40, 48, 64px.
Page horizontal padding	16px mobile; 24px tablet; 32–48px desktop.
Card radius	16–22px.
Primary button radius	999px pill or consistent 16px+ rounded shape.
Dialog radius	20–24px desktop; 20px mobile sheet where appropriate.
Minimum touch target	44 × 44px; prefer 48px for primary controls.
Shadow	Soft and restrained; avoid heavy stacked shadows.

6. Responsive Breakpoint Rules

Breakpoints are layout thresholds, not device detection. Components should also use fluid widths, min/max constraints, and content-driven wrapping.

Viewport	Category	Layout rule
0–359px	Very small mobile	Single column; 12–16px page padding; hide nonessential labels; sheets for secondary UI.
360–479px	Mobile	Single column; timer dominant; bottom/sheet navigation for tasks/settings.

Viewport	Category	Layout rule
480–639px	Large mobile	Single column with wider cards; compact secondary controls may share rows.
640–767px	Small tablet	Centered timer; secondary controls can form 2-column grids where useful.
768–1023px	Tablet	Timer centered; task/settings as side sheet or modal; 24px outer padding.
1024–1279px	Small desktop	Main timer + optional task side panel; max-width container.
1280–1535px	Desktop	Stable two-region layout; generous whitespace; 32–40px outer padding.
1536px+	Large desktop	Do not endlessly stretch content; cap primary container around 1440–1600px.

7. Very Small Mobile: 320–359px

- Timer remains fully visible without horizontal scrolling.
- Header contains only essential brand/menu/streak information; collapse optional text labels.
- Mode selector may use three compact equal-width buttons or a horizontally safe segmented control.
- Primary Start/Pause button spans a comfortable width, approximately 70–90% of the available content width.
- Tasks, settings, music, backgrounds, and statistics open as full-height or near-full-height sheets.
- Avoid fixed pixel widths greater than the viewport minus page padding.
- Do not place more than three compact utility controls in one row unless each retains a 44px hit target.

8. Standard Mobile: 360–479px

Use a vertical hierarchy: header → mode selector → timer → session label → primary controls → compact utilities → challenge/supporting content. Task management should not permanently consume horizontal space.

Recommended mobile geometry

Page padding: 16px. Header height: approximately 56–64px. Main timer region should occupy enough vertical space to keep the countdown visually dominant. Bottom sheets should respect safe-area insets.

9. Large Mobile: 480–639px

Maintain the mobile information architecture but allow wider challenge cards, horizontal utility controls, and two-column mini-stat cards. Do not prematurely introduce a permanent side panel.

10. Small Tablet: 640–767px

Center the timer in a constrained main column. Secondary cards can use two columns. Task management remains a drawer/sheet unless usability testing proves a persistent panel has enough room.

11. Tablet: 768–1023px

- Use approximately 24px page padding.
- Main timer content width should generally remain around 560–720px rather than filling the screen.
- Task drawer may open from the right at roughly 320–380px.
- Settings can use a centered modal around 560–680px wide or a side sheet.

- Landscape tablets must not assume desktop pointer interaction; preserve touch-sized controls.

12. Small Desktop: 1024–1279px

A persistent task panel becomes optional. Recommended layout: flexible main timer region plus 320–360px task panel when open. The timer must remain visually centered within its own region rather than the full browser viewport.

13. Desktop: 1280–1535px

Use a centered max-width application shell. The timer region receives the majority of space; task panel can remain visible without compressing the countdown. Challenges and secondary information should not create a dashboard-like wall of cards.

14. Large Desktop: 1536px+

Cap content width instead of stretching controls. Increase surrounding whitespace rather than dramatically increasing card widths. Timer typography can grow through `clamp()` up to its defined maximum.

15. Height-Based Rules

- For viewport heights below roughly 600px, reduce vertical gaps before shrinking critical controls.
- Never hide Start/Pause because of short viewport height.
- Sheets/dialogs use max-height based on 100dvh and provide internal scrolling.
- Use dvh/svh-aware sizing on mobile to avoid browser-toolbar issues.
- Landscape mobile should use a compact timer layout and keep critical controls above the fold where practical.

16. Component Responsive Rules

Component	Mobile	Tablet	Desktop
Timer	Centered, fluid type	Centered, larger max	Centered in main region
Task panel	Bottom/full sheet	Right sheet	Optional persistent right panel
Settings	Full/near-full sheet	Modal/sheet	Centered modal
Challenge	Full-width card	Constrained card	Constrained below/near timer
Music	Compact sheet/player	Popover/sheet	Popover/panel
Background picker	Grid in sheet	3–4 col grid	4–6 col grid
Stats	1–2 columns	2–3 columns	3–4 compact columns
Primary controls	Large touch controls	Large controls	Do not shrink below accessible size

17. Timer Layout Rules

- Use `font-variant-numeric: tabular-nums` so digits do not shift.
- Do not let the countdown wrap.
- Use `clamp()` rather than breakpoint-specific hard-coded timer sizes wherever possible.
- Reserve enough width for the longest configured display, including hours if custom durations can produce them.
- Progress visuals must not be the sole indication of remaining time.

- Mode change should update accent treatment without causing major layout movement.

18. Background & Glass Rules

- Apply a readability overlay over photographic or animated backgrounds.
- Glass surfaces require a solid/semi-opaque fallback for browsers or contexts where backdrop-filter is unavailable.
- Do not place low-contrast thin text directly over detailed imagery.
- Animated backgrounds should pause/reduce when the document is hidden or reduced-motion is enabled when feasible.
- Custom backgrounds must use the same contrast safeguards as bundled backgrounds.

19. Forms, Dialogs & Sheets

- Inputs are at least 44px high on touch layouts.
- Validation messages appear next to the relevant control and are not color-only.
- Mobile sheets account for env(safe-area-inset-bottom).
- Dialogs trap focus, close predictably, restore focus to the opener, and support Escape on keyboard platforms.
- Destructive task deletion should be clearly differentiated from routine actions.

20. Accessibility & Motion

- WCAG-oriented contrast, semantic HTML, visible focus states, keyboard access, and screen-reader labels are release requirements.
- Use aria-live for completion/status changes, not every countdown tick.
- Respect prefers-reduced-motion and avoid flashing or rapid pulsing.
- Mode state must have text/icon cues in addition to color.
- Hover effects must never be required to discover or operate functionality.

21. Implementation CSS Rules

```
/* Fluid application shell */ .app-shell { width: min(100% - 32px, 1440px); margin-inline: auto; } /*
Timer */ .timer-value { font-size: clamp(4.5rem, 14vw, 11rem); line-height: .9; font-variant-numeric:
tabular-nums; white-space: nowrap; } /* Touch controls */ .control { min-width: 44px; min-height: 44px;
} /* Safe mobile sheet */ .mobile-sheet { max-height: 100dvh; padding-bottom: max(16px,
env(safe-area-inset-bottom)); } @media (min-width: 768px) { .app-shell { width: min(100% - 48px,
1440px); } } @media (min-width: 1280px) { .app-shell { width: min(100% - 80px, 1440px); } } @media
(prefers-reduced-motion: reduce) { *, *::before, *::after { scroll-behavior: auto !important;
animation-duration: .01ms !important; animation-iteration-count: 1 !important; transition-duration:
.01ms !important; } }
```

22. Required Responsive Validation Matrix

Viewport	Orientation	Must validate
320 × 568	Portrait	Very small mobile, no overflow, timer/control visibility
360 × 800	Portrait	Common Android layout
375 × 812	Portrait	Common mobile layout and safe areas
390 × 844	Portrait	Modern mobile layout
412 × 915	Portrait	Large Android mobile
568 × 320	Landscape	Short-height mobile behavior

Viewport	Orientation	Must validate
768 × 1024	Portrait	Tablet layout
1024 × 768	Landscape	Tablet/small desktop transition
1280 × 720	Landscape	Small desktop / short height
1366 × 768	Landscape	Common laptop
1440 × 900	Landscape	Desktop
1920 × 1080	Landscape	Large desktop/max-width behavior

23. Responsive Acceptance Criteria

- No unintended horizontal scrolling at any required viewport.
- Timer, mode selector, and primary Start/Pause control are always usable.
- No text or controls overlap the countdown.
- All touch targets meet minimum sizing.
- Task/settings overlays remain scrollable and closable on short screens.
- Backgrounds preserve foreground readability.
- Desktop content respects maximum width and does not stretch excessively.
- Keyboard navigation works at desktop breakpoints.
- Mobile safe areas and dynamic viewport height are handled.
- Automated visual/responsive checks are supplemented by real-browser manual validation.

24. Developer Rule

Do not create separate duplicated mobile and desktop applications. Build one responsive component system with shared semantic tokens and deliberate layout changes at defined thresholds. Prefer CSS grid/flex, clamp(), min(), max(), minmax(), container constraints, and content-driven wrapping over large sets of device-specific hard-coded values.
